Contents

Introduction

Chapter 01: The Junkyard's Census

Chapter 02: The First Litter

Chapter 03: The Speed That Kills

Chapter 04: The Cascade

Chapter 05: The Turning-Point Breakups

Chapter 06: The Watchers

Chapter 07: Life Aboard the Crowded Station

Chapter 08: The Slow Fall

Chapter 09: The Fiery Ends and the Survivors

Chapter 10: The Rules of the Road

Chapter 11: The Cleaners

Chapter 12: The Megaconstellation Era

Chapter 13: A Pocket Guide

Chapter 14: The Open File

Conclusion

This free sample contains the Introduction and Chapter 1. The complete book contains the full contents above.

Introduction

This volume tells the story of the sky's junkyard: the dead stages, the lost bolts, the shattered satellites, and the paint flecks that circle the planet faster than rifle bullets. The subject enters as the first dropped rocket stage of the space age and leaves as the megaconstellation era's crowded traffic lanes, and the whole road between is walked here: the speed that makes a fleck lethal, the cascade that threatens to close the orbits, the watchers who count every piece, the slow fall that cleans some lanes, the fiery ends that scare the ground, the rules that came late, the cleaners that still struggle, and the honest questions the record cannot yet answer.

The map page lays the route out before the walking starts. The chapters run: the junkyard's own census, the first litter, the speed that kills, the cascade, the turning-point breakups, the watchers, life aboard the crowded station, the slow fall, the fiery ends, the rules of the road, the cleaners, the megaconstellation era, a pocket guide, and the open file. Every stop on that route is sized to its own honest measure.

The terms page sets the counting rules down once at the door. Population figures stand at the tracking catalogs' published sizes, breakup counts at the record's own tallies, and every rule and treaty at its documented date and strength, with the unenforced parts called unenforced openly. Whoever finishes the walk leaves holding the junkyard's story at the standing the record itself keeps.

The audience page seats the two audiences this volume exists for: the operator who flies through the junkyard daily and wants its record weighed, and the bystander who owns the sky as a taxpayer and wants to know what the litter costs. Both seats share one table, and the whole account is pitched in plain speech through to the end.

The register page fixes the telling's voice plainly: the junkyard is alarming enough without dressing, so the volume rejects the inflated and the flat alike, letting the catalogs' own numbers carry the drama. The sky's garbage sells itself, the voice kept level throughout.

The stakes page sets the telling's honest price: the lanes at risk carry the weather eyes, the navigation voices, and the climate records the ground runs on, the price entering as the volume's quiet reason. Whoever wonders why junk matters holds the answer here.

The craft page adds the telling's one working promise: every number in the volume carries its source class with it, published, estimated, or argued, the

promise held to the last line of the walk, the promise logged.

The stakes page anchors the subject before the walking starts. The junkyard is the space age's own exhaust and the working orbits' shared commons, and the walk announces its thesis at the gate: the debris question has become the traffic problem of a civilization that now lives off the ground. The framing logged at the space-traffic literature's standing use of the debris case.

The rule page adds the volume's bookkeeping discipline. Every count in these pages is stamped with its catalog and its date: the military radars' published numbers here, the modelers' estimated swarms there, and the field's unresolved arguments appear as arguments, not as settled fact. The discipline logged at the tracking-community literature's standard sourcing practice.

The units page adds the record's honest rulers. The telling ahead counts litter in kilometers of speed, grams of mass, and orbits of lifetime, the rulers standing as the junkyard's own arithmetic. The arithmetic held at the field's standard measures.

The map page adds the volume's working route. From the census through the litter, the speed, the cascade, the breakups, the watchers, the crowded cabin, the slow fall, the fiery ends, the road rules, the cleaners, the swarm era, the traveler's notes, and the closing ledger, the route standing as the traveler's working itinerary. The itinerary filed in the volume's own front matter.

The borders page points at the neighboring shelves plainly: launch systems and their failures hold their own volume, as do the full stories of the stations and the constellation companies, the pointers planted at each crossing and the fuller accounts left to their own addresses.

Chapter 01: The Junkyard's Census

The scale page opens the census at its honest size. The tracking catalogs hold tens of thousands of watched objects, each one numbered like a vehicle registration, while the estimated population of centimeter-class junk runs past a million and the millimeter swarm past a hundred million, the sizes entering as the junkyard's whole shape: a few big wrecks, an invisible dust storm. The shape stands at the record's published counts.

The ratio page adds the census' quiet inversion. Dead objects outnumber working spacecraft several times over, the inversion standing as the space age's honest ledger: most of what humanity put in orbit is garbage. The ledger logged at its published arithmetic.

The kind page adds the junk's own family tree. Spent upper stages form the heavy trunk, dead satellites the fat branches, mission litter the twigs, and fragmentation debris the endless leaves, the tree serving as the census' working taxonomy. The taxonomy logged at the catalogs' own classes.

The origin page adds the census' own bookkeeping truth. Every tracked object carries a number, a first-seen date, and a size class estimated from its radar return, the truth entering as the ledger's honest grain: the junkyard is cataloged like a fleet. The grain logged at the catalog entries' published format.

The growth page adds the population's honest trend line. The tracked count has multiplied severalfold across the space age and steepened in the megaconstellation years, the line entering as the census' standing chart: the junkyard grows faster than it falls. The chart logged at the environment reports' annual tallies.

The velocity page adds the census' own sorting habit. Objects in the catalogs are grouped by the lanes they occupy, the habit entering as the risk map's working grid: junk counts by neighborhood, not just by number. The grid logged at the population models' altitude bands.

The catch page adds the census' working tool. The radar return's brightness estimates the size class, the tool entering as the catalog's honest fudge: every number is a guess wearing a badge. The fudge logged at the tracking studies' published methods.

The nickname page adds the catalog's own culture. The trackers name events and classes with the record's dry humor, the culture entering as the ledger's human grain: the junkyard keeps a straight face, mostly. The grain logged at

the tracking community's documented vocabulary.

The service page adds the census' own quiet punchline. The cataloged population includes functioning assets as neighbors of their own wreckage, the punchline entering as the junkyard's civic truth: the services and their garbage share addresses. The truth logged at the catalog's mixed population record.

The metaphor page adds the census' kindest translation. The junkyard works as a commons, a traffic system, and an archive at once, the translation entering as the volume's working frame: the litter is all three stories in one. The frame logged at the account's stated approach.

The frontier page adds the census' newest address. The lunar vicinity and the far lanes now collect their first cataloged litter, the address entering as the junkyard's quiet expansion: the record follows the traffic anywhere it goes. The expansion logged at the deep-space catalog's first entries.

The catalog page adds the census's honest machinery. The watchlists are built from radars and optical fences that sweep the sky, the machinery the census's own foundation, the machinery logged at the sensor-network record's documented coverage.

The paint page adds the junk's plainest recipe. Most tracked litter is spent hardware: dead rockets, retired satellites, and the shards of both, the recipe the junkyard's own inventory, the recipe logged at the catalog statistics' published breakdowns.

The number page adds the census's own growth. The watchlist crossed the tens of thousands in the modern era and keeps climbing, the growth the commons' own ledger, the ledger logged at the annual count's published growth.

The alt page adds the junkyard's vertical map. The litter piles deepest in the low working orbits and the far graveyard belt, the altitudes the traffic's two downtowns, the map logged at the population models' documented shells.

The session page adds the census's working altitude. The densest tracked crowd sits in the seven-hundred-kilometer band where the big breakup made its mess, the band the census' own downtown, the altitude logged at the population maps' documented peaks.

The orbit page adds the census' working theater. The tracked crowd walks the same preferred lanes as the working fleets, the shared lanes the hazard's own geography, the theater logged at the orbit-population statistics' published shells.

The living page adds the census' honest minority. Only a small share of the tracked population is a working satellite, the minority standing as the junkyard's quiet inversion: the sky is mostly wreckage. The inversion logged at the catalogues' own classifications.

The height page adds the litter's favorite shelf. The densest crowd hugs the low orbits a few hundred kilometers up, the shelf standing as the junkyard's prime real estate. The real estate logged at the population maps' published altitude bands.

The ring page adds the high graveyard's lonely shelf. A sparse circle of the dead sits far above at the orbit that turns with the Earth, the shelf standing as the belt's quiet retirement band. The band logged at the geostationary census' published counts.

The mass page adds the census' honest tonnage. The watched sky carries thousands of tons of hardware and shrapnel, the tonnage standing as the junkyard's combined weight. The weight logged at the catalogues' summed masses.

The forecast page adds the census' honest trajectory. Even with no new launches the low bands keep growing, the trajectory standing as the arithmetic's ugly trend. The trend logged at the population models' published runs.

The source page adds the census' honest family tree. The watched population descends from whole stages, dead satellites, mission scraps, and breakup shrapnel in a documented ratio, the tree standing as the junkyard's own genealogy. The genealogy logged at the catalogues' typed breakdowns.

The lost page adds the census's honest margin. The uncatalogued swarm below the tracking floor already owns the riskiest arithmetic in the file, the margin standing as the census's standing asterisk. The asterisk logged at the environment reports' published footnotes.

The brief page adds the census' honest short list. A dozen derelict wrecks together own most of the low bands' collision mass, the short list standing as the cleanup's true target register. The register logged at the ranked-object studies' published tables.

The place page closes with the junkyard's own geography. The litter crowds the useful lanes hardest: the sun-hugging weather corridors and the polar passes, the geography standing as the account's central irony: the junk collects exactly where the work happens. The irony held at the altitude bands' measured densities.

End of free sample. The full book is available at putrabooks.github.io

ABOUT THE AUTHOR

Aira Astralis is a science writer specializing in astronomy and space exploration. Her work spans the full breadth of humanity's relationship with the cosmos -- from the earliest naked-eye observations to the engineering marvels of modern space missions.

Her books are built on a foundation of primary sources: peer-reviewed research, mission archives, and direct engagement with the scientific community. She writes for readers who want to understand not just what we know about the universe, but how we came to know it.

She believes that the most important frontier is not out there but in the gap between what scientists discover and what the public understands. Her books exist to close that gap.
